Logistics Final Project

Amanda Johnson, Milwinda Castillo, & Nick Morris

Approach

Strategic Plan → Already defined by the company (Qty and size of boats and ports).

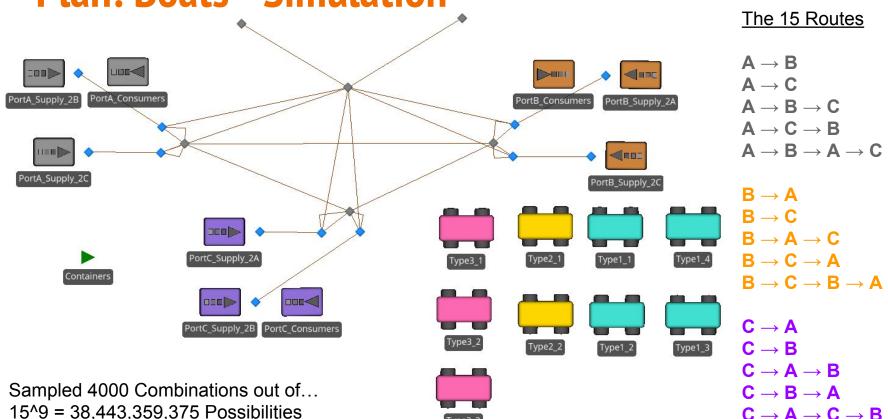

Tactical Plan → Boat assignment and routing.

Decision made to satisfy the aggregated demand in 6 month period Method used: Simulation

Operational Plan → Full and empty containers planning (Ship, Buy, Lease, Sell)

Decision made in daily, weekly, monthly basis. Method used: A Cost-Benefit Balancing Approach

Plan: Boats - Simulation

Type3_3

Plan: Boats - Routes

| | boat 1 | boat 2 | boat 3 | boat 4 | boat 5 | boat 6 | boat 7 | boat 8 | boat 9 |
|-----------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Route: | C_A | B_A | C_A | C_A | C_B | C_B | A_B | C_B | A_B |
| Depart: | -5 | -3 | -4 | -4 | -7 | -7 | -3 | -7 | -1 |
| Capacity: | 500 | 500 | 500 | 500 | 1200 | 1200 | 750 | 750 | 750 |

The majority of the routes include Port C. This is due to...

| Port | Demand |
|---------|--------|
| Port A: | 6116 |
| Port B: | 7977 |
| Port C: | 17955 |

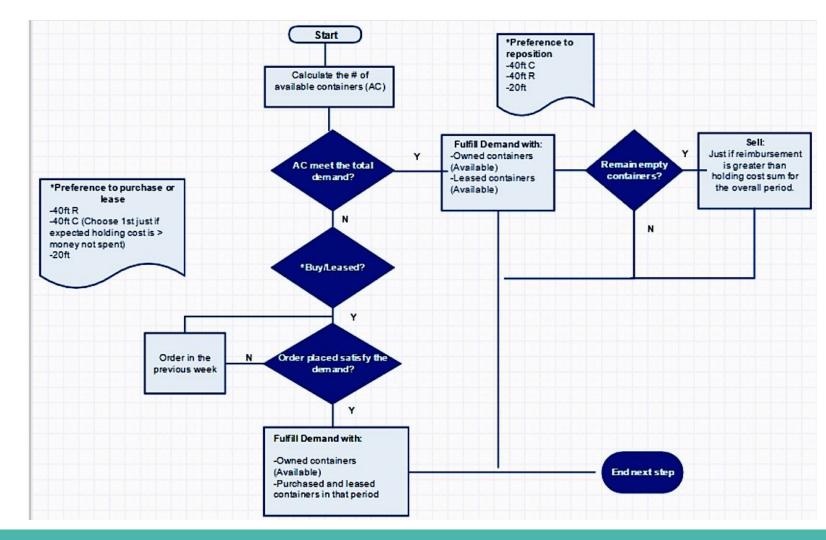

Plan: Containers

Methodology (Decision making process):

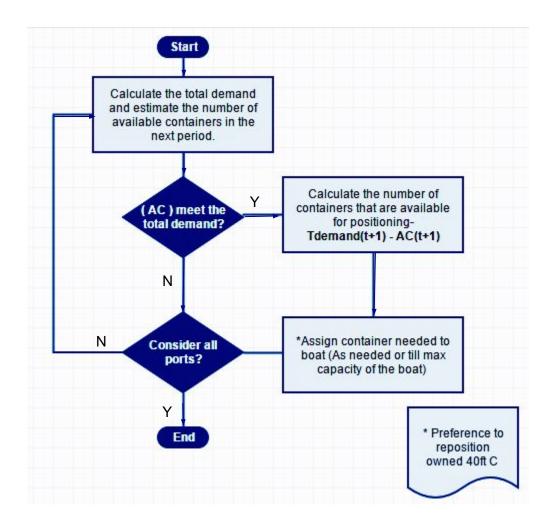

Steps

- 1. Identify the consumer, producer and balanced ports. $AB \rightarrow Balanced \qquad AC \rightarrow Producer/Consumer \qquad BC \rightarrow Producer Consumer$
- 2. Assign the empty containers to fulfill the demand based on the number of on-hand empty containers. The procedure of this step is Fig step 2.
- 3. Do step 2 for each of the ports in a given period.
- **4. Position empty containers in a given period for Produce/Consumer ports.** *The procedure of this step is Fig step 4.*
- 5. Do from step 2 to step 4 for all the periods.

Step 2.

Step 4.

Plan: Containers

- 1. Plan purchasing activities and delivery schedules based on the requirements.
- 2. Inventory system used to estimate the inventory level

Determine the quantity to keep in inventory to satisfy the demand (Minimizing the holding cost) in each port.

```
Inventory<sub>kpt</sub> = I_{t-1} + Returned<sub>kpt</sub> + Repositioned<sub>kpt</sub> + Bought(Received)<sub>kpt</sub> + Leased(Received)<sub>kpt</sub> - Sold<sub>kpt</sub> - Shipped<sub>kpt</sub>
```

K- Type of container

P- Port

T – Time period

Plan: Containers

Assumptions

- 1. Each port has enough container to satisfy the first shipment.
- 2. The average estimated length of stay per container at each port is 1 week Returned_{kot} = 80% Shipped_Full_{kot-3}
- 3. No lost sales allowed (Everything would be shipped)
- 4. Condition under which would be more cost effective:.
 - Buy or lease.
 Lease if the leasing cost * #weeks keep it is < purchase cost
 - Sell.
 Sell if holding cost sum > The expected Reimbursement (Purchase cost selling price)

| 40ft R | Reimbursement (\$1800 -\$1400) = \$400 | Holding cost sum from (t \rightarrow t+1) \$80*(4) = 320 | Sell? No |
|--------|---|--|---------------------|
| 40ft R | Leased = \$110* (52weeks)= \$5720 | \$1800 /\$110 per week = ~16 weeks | Lease? No |

| | New Containers delivery lead times (weeks) | | | | | | | | | | | | |
|------|--|---|---|--|--|--|--|--|--|--|--|--|--|
| | A | В | С | | | | | | | | | | |
| 40 R | 1 | 1 | 1 | | | | | | | | | | |
| 40 C | 2 | 3 | 1 | | | | | | | | | | |
| 20R | 1 | 1 | 1 | | | | | | | | | | |

Plan: Coordinating Boats & Containers

Boat composition:

| Capacity | 500 | | 500 | | | 1000 (5 | i00 x2) | | | 315 | 0 (1200x2 | 2 + 750) | | | 750 | | 750 | |
|-------------|------|------|------|-------|------|---------|---------|------|-------|------|-----------|----------|-------|----------------|--------|------|--------|------|
| Route 2 | boa | t 1 | bo | at 2 | boat | t 3 | boa | t 4 | boa | t 5 | boa | at 6 | b | oat8 | boat 7 | | boat 9 | |
| Route: | C_A | A_C | B_A | A_B | C_A | A_C | C_A | A_C | C_B | B_C | C_B | B_C | C_B | B_C | A_B | B_A | A_B | B_A |
| Full Loaded | 100% | 100% | 100% | ~100% | ~50% | 100% | ~50% | 100% | ~ 50% | 100% | ~ 50% | 100% | ~ 50% | ~50% - 100% | ~70% | ~70% | ~35% | ~35% |
| Empty | 4 | | | | ~50% | | ~50% | | | 5 | | | | ~50 - 100% | | | | |

Purchasing schedule:

- Leased = 0
- Sold= 0

| Route 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|
| Port A | Week | -7 | -6 | -5 | -4 | -3 | -2 | -1 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 |
| 40 ft R (1 week | Ordered | 300 | 300 | 300 | 300 | 300 | 300 | 300 | 300 | 300 | | 117 | 300 | 300 | | | 300 | 300 | 300 | 300 | 300 | 300 | | | | | | | | | | | | | |
| lead time) | Received | | 300 | 300 | 300 | 300 | 300 | 300 | 300 | 300 | 300 | | 117 | 300 | 300 | | | 300 | 300 | 300 | 300 | 300 | 300 | 1 | | | | | | | | | | | |

Results - Cost / Service Level

| Origin | Destination | Expected Aggregated demand | Shipped | Satisfaction |
|--------|-------------|----------------------------------|---------|--------------|
| | В | 5235 | 5235 | 100.00% |
| A | С | 7328 | 7093 | 96.79% |
| | A | 4098 | 4098 | 100.00% |
| В | С | 10924 | 6300 | 57.67% |
| | А | 2018 | 2018 | 100.00% |
| С | В | 2823 | 2823 | 100.00% |

System service level: 85.02%

| Cost | Value |
|-------------|-----------------|
| Inventory | \$12,687,325.00 |
| Purchase | \$21,284,400.00 |
| Positioning | \$8,410,306.00 |
| Set up | \$3,315,000.00 |
| Total cost | \$45,697,031.00 |

Limitations

Stage: Routing and Boat Assignments

- 1. The amount of route combinations evaluated in the simulation are an insignificant proportion of the total possible combinations.
- 2. The departures evaluated were limited to a boat leaving on time to make the first week forecast delivery, waiting one week, and waiting two weeks.
- 3. The simulation ignored information such as:
 - a. Setup, Holding, and Handling Costs
 - b. Purchased Container Lead Time
 - c. Returned Containers from Customers
 - d. Delayed Customers Pick Up's

... to evaluate which combination of routes provide generally high service levels.

Limitations

Stage: Container Limitations

- 1. Safety stock for the empty containers were not considered
- Backorder cost was not considered

Further work:

- 1. Include a **(m, n)** policy to determine when should we import/export empty containers.
- **import** empty containers **up to "m"** when the number of empty containers in the port **is less than "m"**.
- or exporting empty containers down to "n" when the number of empty containers is larger than "n"

What makes them useful?

- They collapse when empty and can be stored in a smaller space:
 - o Can ship 4 empty collapsible containers in the space of a single regular container
 - Holding costs at ports are about 5 times lower for collapsible than regular containers

What are the drawbacks?

- They are more complicated than regular containers:
 - Harder to handle and move onto and off of boats
 - Cost to move is about \$30 more per container
 - More expensive to buy or lease
 - \$1200 more per container to buy
 - \$95 more per container per week to lease

When are they useful?

- If containers sit empty in ports for a while:
 - o Difference in cost to buy: \$1200
 - Difference in cost to Hold empty:
 - Port A: -\$55
 - Port B: -\$115
 - Port C: -\$75

- Payback Periods
 - Port A: ~22 weeks
 - Port B: ~10 weeks
 - Port C: ~17 weeks

What would make this Reasonable?

- The longest times that our containers sit:
 - Port A: ~9 weeks; 100 containers
 - Port B: ~10 weeks; 160 containers
 - Port C: ~13 weeks; 220 containers
 - Average Longest wait: ~11 weeks
- If 11 weeks were the payback period
 - o Port A: \$605→ \$2405
 - o Port B: \$1265→ \$3065
 - Port C: \$825→ \$2625
 - Average Price: \$925→ \$2725
 - Lowering the container price by \$275 makes them reasonable

When are they useful?

If shipping containers is the most reasonable way to obtain them:

| | | Max# | The second secon | | | # of Trips Needed | # of Trips Needed | | Room Left | |
|--------|--------|------------|--|--------------|------------------|--|-------------------|--------------|--------------|--------------|
| Port 1 | Port 2 | Containers | Price Collapsible | Price Reg | Price Difference | 100 C. | (collapsible) | Boat 1 (250) | Boat 2 (600) | Boat 3 (375) |
| Α | В | 35 | \$163,125.00 | \$164,200.00 | \$1,075.00 | 2 | 1 | 465 | 1165 | 715 |

Only ever reasonable if you are spreading across multiple ships

What would make this Reasonable?

- The savings come from limiting the number of trips you need to make
 - To be cost effective, we would need to incentivise the use of smaller boats
 - Otherwise there is virtually no reason to spread the containers across multiple boats

| Port 1 | Port 2 | Max # Containers | # of Trips Needed (Regular) | # of Trips Needed (collapsible) | Capacity if filling Ships | Max Capacity |
